

Report on NARBA's 2020 Pricing and Marketing Survey

Daniel Tregeagle¹ and Debby Wechsler²

¹Assistant Professor and Extension Specialist, Department of Agricultural and Resource Economics, North Carolina State University
²Executive Secretary, North American Raspberry and Blackberry Association

Thank you to all the growers who responded to our survey and to everyone who helped spread the word. Special thanks to Jennie Popp and Leah English at the University of Arkansas who designed the 2018 version of this survey and allowed us to adapt it to 2020.

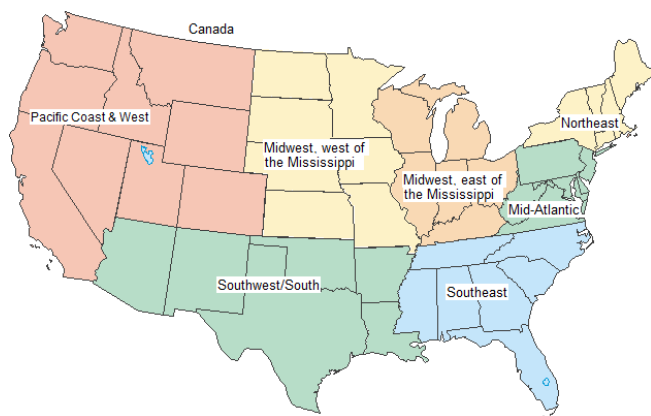

Raspberry | Blackberry | Pricing | COVID-19
 Correspondence: tregeagle@ncsu.edu

Respondents

Number of respondents. NARBA's online survey was open from June 1 and we asked respondents to answer by June 22. In this time we received 215 responses. Of these, 8 indicated that they are not growing caneberries and an additional 80 were incomplete or invalid. Results were considered incomplete if price data was not entered or if the entered data was a clear outlier. The results in this report are calculated using the remaining 127 valid responses, a roughly 20 percent increase from 2018.

Location of respondents. Respondents were asked to provide their location at the state/province level. These responses were grouped into regions for privacy and statistical purposes. The three regions with the highest percentage of responses were Midwest, east of the Mississippi (23 percent), Southeast (20 percent), and Southwest/South (19 percent). Canada provided the fewest responses with four percent of the total responses.

Fig. 1. Regions used in this survey

Region	Respondents (%)
Canada	4
Mid-Atlantic	11
Midwest, East	23
Midwest, West	7
Northeast	7
Pacific Coast and West	11
Southeast	20
Southwest / South	19

Table 1. Percentage of growers from each region

Crops grown. The majority of caneberry producers surveyed grew blackberries (51 percent), with 20 percent growing raspberries and 29 percent growing both (figure 3).

Years in caneberry production Our respondents have a wide range of experience, ranging from respondents in their first year of caneberry growing to a respondent with 70 years experience growing raspberries. On average, our respondents had ten years of experience growing blackberries and 16 years growing raspberries. Canadian growers are most experienced, where 80 percent of respondents have over ten years of caneberry experience. The Northeast and Pacific Coast and West regions also have over 60 percent of respondents with more than ten years of experience. Midwest, west of the Mississippi, Southeast, and Southwest/South have more than half

Fig. 2. Caneberries grown by respondents in 2020

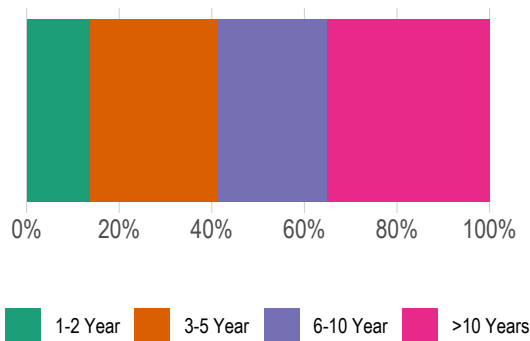

Fig. 3. Years in Caneberry Production

of their respondents with five or fewer years of experience. The Northeast and Southeast had the most new growers, with around one quarter of respondents from these regions having only one to two years experience.

Acres in production. The average caneberry farm in our survey had around 4 acres in caneberry production, with the smallest grower reporting 0.02 acres of caneberry production and the largest grower reporting 100 acres. The distribution of acreage was similar between blackberries and raspberries. ‘Less than one acre’ was the most common response for both blackberry (33 percent) and raspberry (41 percent) growers and fewer than ten percent of respondents had more than ten acres of caneberries. The majority of respondents had one to ten acres of caneberries.

Marketing Methods

Since we were focused on direct-market prices—partly because growers have little control over prices in wholesale and processing markets—few large producers participated, though quite a few growers (21 percent) indicated they sold both wholesale and retail. Our survey distinguished between “small” wholesale, primarily sales to local stores and restaurants and fruit stands, and “large” wholesale, or sales to supermarket chains or through major marketers. Approximately 54 percent of respondents sold only at retail and 13 percent sold only to wholesalers. U-Pick was the most popular marketing method, used by over half of both types of grower. For both caneberries, farm stands were the next most popular marketing method, however it was somewhat more popular with raspberry growers (47 percent) compared to blackberry growers (36 percent). Farmers markets were used by around one quarter of the respondents. Selling to small wholesalers was the most popular method of wholesale marketing, followed by selling to large wholesalers and processors. Raspberry growers were more likely to sell to small wholesalers, and blackberry growers were more likely to sell to large wholesalers and processors. Other marketing methods included selling to local schools and selling online. The popularity of different marketing methods varies by region. The table 3 shows the percentage of growers in each region

using each method. The rows will not sum to 100 percent as many growers use multiple marketing methods.

Pricing

For each market type, we asked growers what prices they receive. The following section summarizes these results.

Sales units. We did not ask growers to convert their prices into a common unit (e.g., pounds) which would have made averaging and comparisons easier, but instead asked them to report prices in the units they sold in. Averages and comparisons are difficult to make with confidence. Clamshells containing 6 oz. or 12 oz. of berries may sometimes be reported as half-pints or pints. In addition, “oz.” can mean either volume or weight, while a “gallon” is not actually a legitimate measure of a dry material like berries, only of liquids, and there are also great differences in how high buckets or cups are mounded up. However, for this analysis, we assumed volume measures were comparable (e.g. one pint equals two half-pints) and that a pint of berries weighs $\frac{3}{4}$ pounds. We also excluded flats from this analysis, since their price and composition were highly variable.

Average prices. Table 3 summarizes the average prices per pound received by respondents by region and marketing method. Across all regions and marketing channels, blackberries sold for an average price of \$4.67 per pound and raspberries sold for an average price of \$5.82 per pound. There was moderate variation in these prices across regions, with average prices for blackberries ranging from \$4.02 per pound in the Pacific Coast and West to \$6.13 per pound in Canada, and average prices for raspberries ranging from \$4.39 per pound in the Pacific Coast and West to \$6.52 per pound in the Mid-Atlantic. There was substantial variation in prices across marketing methods with average Farm Stand prices for blackberries reaching as high as \$10.67 per pound as low as \$0.53, both in the Pacific Coast and West. For Raspberries, average prices ranged from as high as \$8.61 per pound at Farm Stands in the Mid-Atlantic, and as low as \$3.17 for U-Pick raspberries in the Pacific Coast and West.

For most growers, these prices have been stable, with 76 percent of blackberry growers and 68 percent of raspberry growers reporting that their prices are the same as last year. For blackberry growers, 19 percent reported that their prices are higher this year than last year, and only five percent reported that their prices are lower. For raspberry growers, 32 percent of respondents reported that their prices are higher this year than last year, and no growers reported that their prices are lower. For growers reporting the same price this year as last year, the majority of growers have kept these prices for two to three years (figure 4).

COVID-19 Impacts

COVID-19 has caused an unprecedented disruption in markets around the US and globally. To help understand how this crisis has impacted caneberry growers, we included several questions asking about COVID-19 impacts. In particular

Table 2. Percentage of growers using each market type by region

Region	Marketing Type Used (%)						
	Farm Stand	U-Pick	Farmer's Market	Wholesale (small)	Wholesale (large)	Processor	Other
Canada	60.0	0.0	0.0	20.0	40.0	0.0	0.0
Mid-Atlantic	30.8	46.2	30.8	38.5	0.0	15.4	7.7
Midwest, East	71.4	64.3	35.7	14.3	3.6	10.7	0.0
Midwest, West	37.5	62.5	50.0	25.0	12.5	25.0	12.5
Northeast	37.5	50.0	12.5	25.0	0.0	12.5	0.0
Pacific Coast and West	30.8	46.2	23.1	23.1	7.7	23.1	7.7
Southeast	28.0	44.0	20.0	12.0	24.0	4.0	8.0
Southwest / South	26.1	78.3	21.7	8.7	8.7	4.3	4.3

Table 3. Average prices per pound received by respondents by market and region

we asked how customer volume, sales per customer, and total sales have changed in comparison to a normal year, and whether the respondent thought these changes were due to COVID-19. In addition, we asked several open-ended questions about how growers are adapting, which give a sense of the diversity of responses to the crisis.

Changes in customer volume and sales. Figure 5 summarizes the responses for blackberry and raspberry producers. For customer volume, 38 blackberry producers answered the question, with 47 percent having a usual level of customers, and 53 percent having more customers than usual. For raspberries, 17 growers answered the question, with 65 percent having the same level of customers as usual and 35

percent having more customers than usual. For sales per customer, 40 blackberry producers answered the question, with 80 percent of respondents having the usual level of sales per customer and 20 percent having a greater volume of sales per customer. Similarly for raspberries, 18 growers answered the question, with 78 percent having the usual level of sales per customer and 22 percent having greater than usual sales per customer. For sales, 47 blackberry producers answered the question, with 15 percent having fewer sales than usual, 46 percent having a usual level of sales, and 38 having more sales than usual. Similarly with raspberries, 23 producers answered the question, with 17 percent having fewer sales than usual, 52 percent having a usual level of sales, and 30 percent having more sales than usual.

Fig. 4. Number of years growers have had the same prices

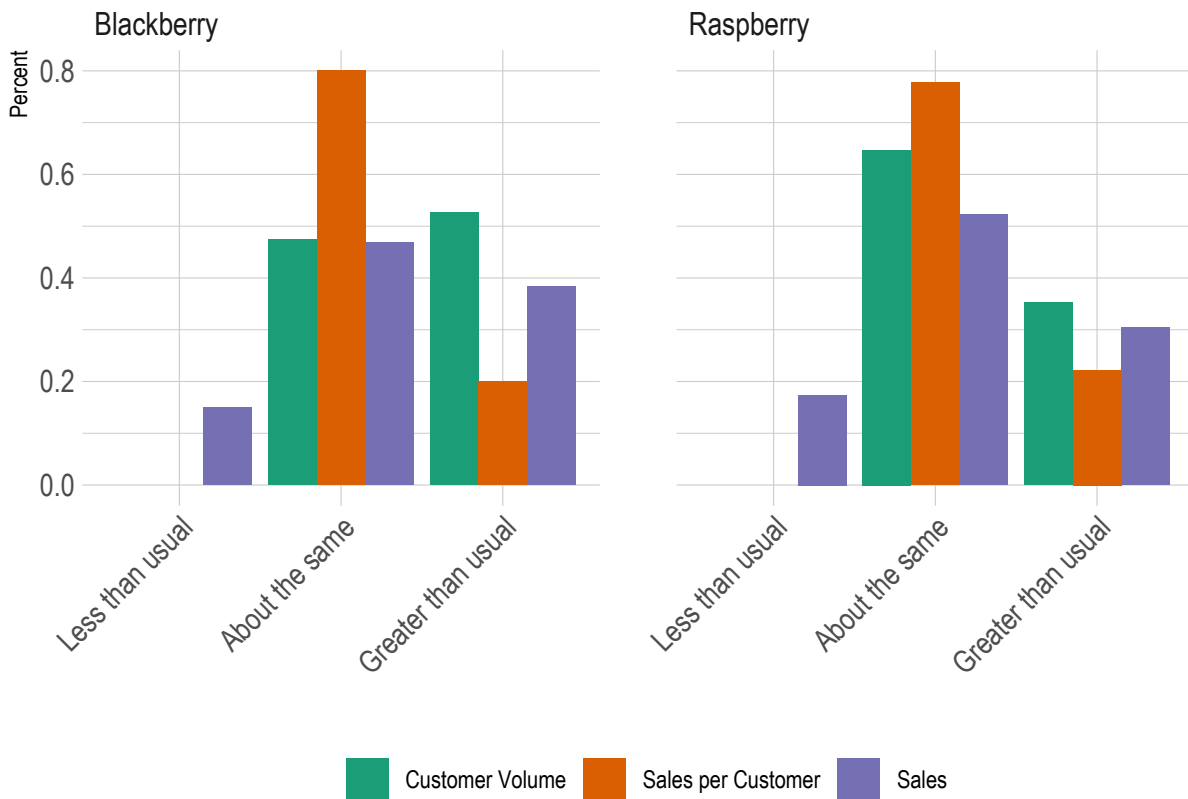

Fig. 5. Responses to questions about changes in volume and sales this year

While some marketing channels, like institutional and restaurant sales, have suffered during the COVID-19 pandemic, anecdotal reports suggest that direct-to-consumer sales have increased (2, 3). This appears to be the case for our respondents, with a majority experiencing usual, or higher than usual, customer volume, sales per customer, and sales.

To investigate the link between the change in sales and the sales method we looked at how these responses changed as respondents had increasing wholesale sales. Since we did not ask respondents how their sales and volume changed for each

specific market, we calculated the effect of wholesale sales on their responses using a statistical model. To prepare the data, we classified ‘wholesale (small)’, ‘wholesale (large)’, and ‘processor’ sales as wholesale sales and calculated the wholesale percentage of each respondents sales. We then fitted a ordered logistic regression model (1) where the respondent’s answer is predicted as a function of their percentage of wholesale sales.

Figure 6 shows the results of the analysis for the change in customer volume and sales. The effect of the percentage of

wholesale sales on respondents' answers for sales per customer was statistically insignificant (i.e. there was no measurable effect) so we do not show results for this model. For the change in customer volume, an increasing percentage of wholesale sales reduced the probability of the respondent answering that their customer volume had increased for both types of berries. For the change in sales, an increasing percentage of wholesale sales had almost no effect on the probability of answering that sales were about the same, but as the percentage increased, the respondent was more likely to answer that their sales were less than usual and less likely to answer that their sales were greater than usual. These results are consistent with the observation that direct to consumer sales have remained steady or increased, while wholesale sales have declined.

Selected Grower Responses

Several questions in the survey asked respondents to enter text comments. While we originally thought to include a checklist of possible COVID-19 adjustments, instead we decided to let respondents highlight whatever aspects they chose in their own words. Below is just a selection of these comments.

What adjustments are you making for COVID-19?

- Separate check-in and check-out stations. Extra cleaning/sanitizing, social distancing. Customers will be supplied new pulp pints in new cardboard trays (charge of \$1.00 per tray is new this year), no reuse of trays or pulp pints). Installing handwashing stations (one at entrance and one at porta-potty); have used hand sanitizers in past. Encouraging small groups. We will switch to electronic payments.
- Asking people to wear a mask at the stand and one car at the stand at a time.
- I haven't yet sold any berries, but I suspect my two restaurant buyers will decrease purchases and my farmers market customers will increase purchases. Depending on demand, I might sell only 1/2 pints to maximize sales and please maximum number of customers.
- Specific COVID-19 signage in multiple locations.
- Added COVID-19 specific health training along with normal food safety training for everyone.
- Following state guidelines for reopening: recommend wearing masks, parents keep kids with them, observe social distancing. All employees wear masks.
- Because we have to limit the number of customers in the patch, it actually is more difficult to get the berries picked as quickly as we normally would. This is a young patch of berries, so we could get many more customers if we didn't have to limit the number in the patch. I do not request that my customers wear face

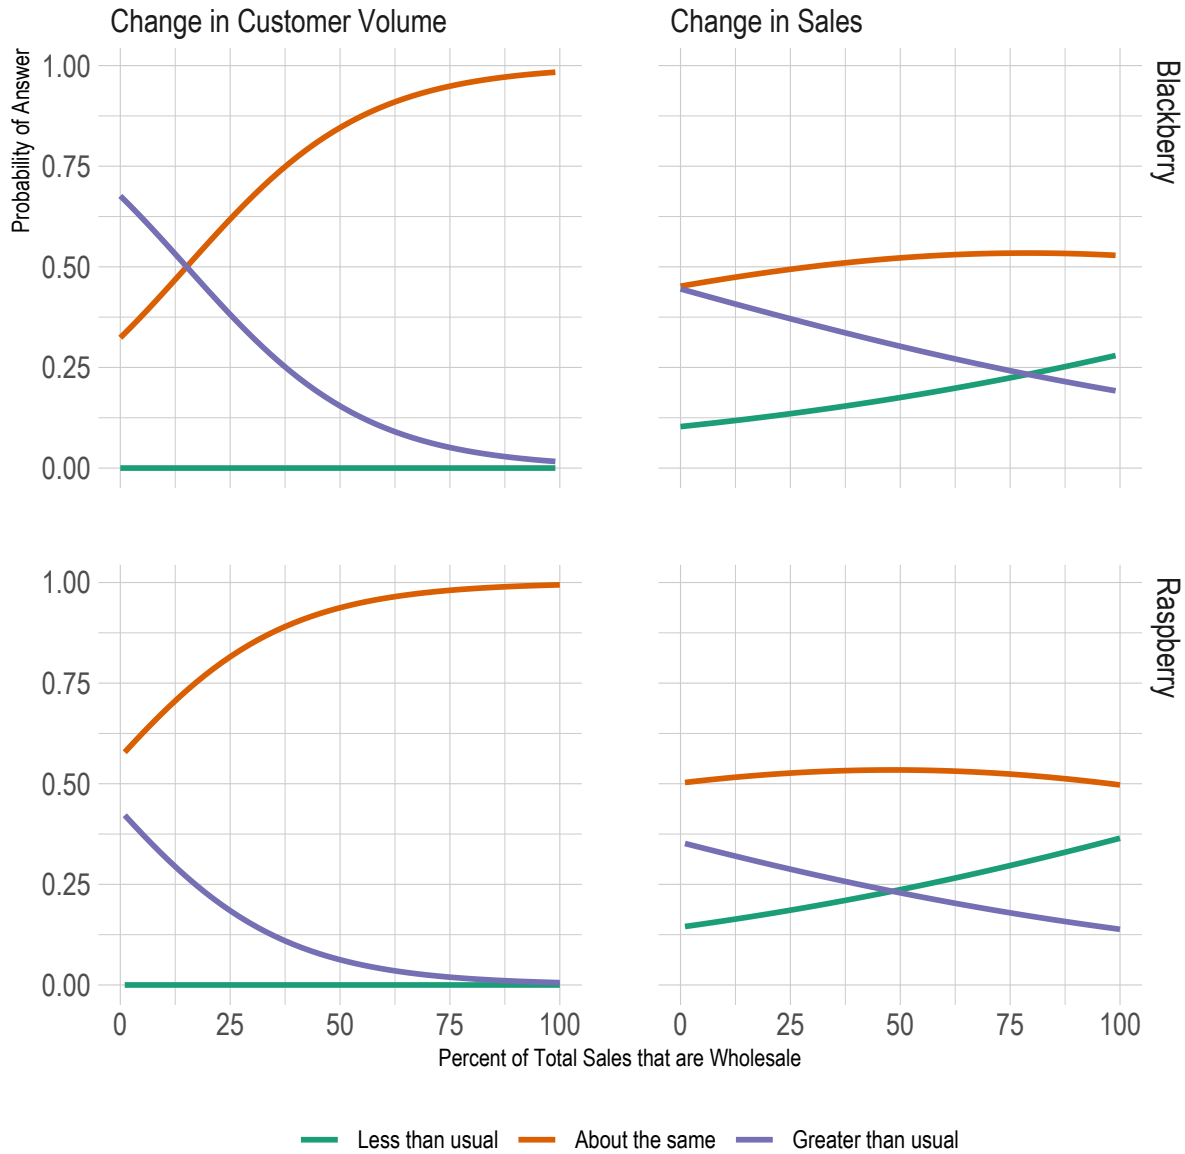

masks. I let them monitor themselves. Social distancing works best.

- Sanitizing more, keeping the field clean, and limiting crowds at the farm by implementing by-appointment-only.
- No adapting.
- We have more experience with strawberries than blackberries given we just started picking blackberries yesterday. As a result, some of my answers are more related to strawberry season. We are implementing a scheduling system to gain access to the field due to COVID. We are charging \$3.00 per person to gain field access and limiting the total number of guests that can be in the field at one time. That influenced our decision to keep blackberry pricing flat. We did not offer strawberry PYO this spring and increased pricing in our store to \$35 per flat of eight 1-pound containers. Demand was huge. I need PYO blackberries to operate this summer because I do not have enough labor to harvest both them and my peach crop.
- Selling by the container this year instead of by the pound but the prices for the boxes we are selling are approximately the same as if the customer filled the box and paid by the pound.

Do you have any COVID-19 advice to share?

- Follow specific advice of your state extension services and ag schools. Find the information which is readily available online including at NARBA website, understand it, apply it, and then figure out how to do all of this and still be profitable. Even during this pandemic consumers want high quality healthy food and are buying berries at what are good prices for the growers. Be thankful that consumer demand is remaining strong so far.
- Follow CDC advice. This is no joke. If your harvest crew gets COVID-19 you may get shut down and lose your entire harvest.
- Keep people informed on social media about your changes before season starts
- Selling by the box reduces interaction between your staff and the customer but also guarantees you get the most money for your crop because they buy the box whether they fill it or not
- Just follow CDC guidelines, use common sense and make your customers feel safe at your farm.
- Respect the needs of each individual visitor. Practice social distancing and make the farm experience fun and enjoyable. Try and limit multiple touch surfaces.
- Follow science and be safe.

Fig. 6. Probability of respondents' answer depending on their percentage of wholesale sales

Additional comments.

- The farmers markets I attend have launched pre-order pre-payment on the internet in response to COVID-19 and it has proven quite successful in the six weeks it's been in operation. The expectation is that this system, coupled with pre-pandemic customer browsing and buying, will continue even after the pandemic is over because it boosts overall sales.
- I would be interested in learning how pack houses are handling COVID. I know the meat packing industry has had many issues of outbreaks and I have heard of a few in the fruit industry. I have not seen any operating guidelines in the trade journals yet. I'm curious how employees are most at risk and what are the best safety measures to implement. It appears this is a greater risk

area than employees working outdoors harvesting.

- Sales of blackberries this year have been excellent. We went through strawberry sales, and they were definitely better than last year. Blackberries are following suit. Seems more people want fresh fruit, and are also trying their hand at making cobblers and also making jam. Also, the customers appreciate a trip out to the farm to see where their fruit and produce come from. More people say they will be buying local this year.
- Many of the adjustments could become SOP in the future.

Discouraged comments.

- This is the last year I will grow blackberries. Foreign market price has made it impossible to grow blackber-

ries at a profit. Between weather disasters and pricing that hasn't changed in 40 years we can't even make it worth growing any more even with large acres. Higher labor cost and overall input cost have driven me out of the business. America wants cheap food at any cost to the economy and the people that have sacrificed their lives to give it to them.

- Mexico dumped blackberries on the market for \$5.50 a flat. American Farmers can't survive at these prices.
- Our prices are low in our minds as we compete with low price imports and bigger specialty market fruit stands, little guys like us are retiring from the fresh fruit market and now we now use most of our fruit in our own fruit winery!
- Our blackberries are just starting to bloom. In past years, we had berries setting at this time. We have had cool weather and a lot of rain, this year.
- On April 18 we had a temperature of 26 during the

night which resulted in approximately an 80% loss in our production of blackberries this year 2020.

Positive last words.

- I really think our business will increase as people love to be outdoors away from the virus.
- Local farm stands in our area are doubling sales over previous years.
- This will be our greatest year ever!
